Paracord Rifle Sling

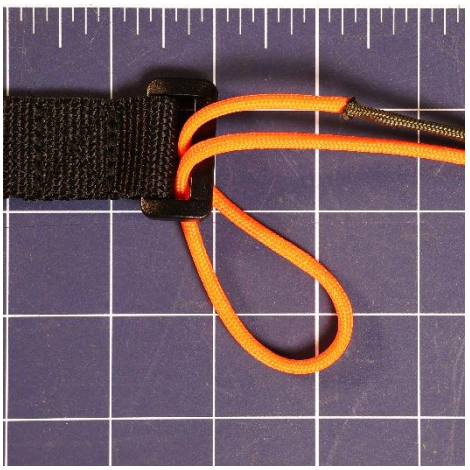

For Supplies, You Will Need:

- 14 ft. of color 1
- 16 ft. of color 1
- 14 ft. of color 2
- 16 ft. of color 2
- Webbing segment with sling swivel or HK sling clip
- Detached sling swivel or HK sling clip
- A Scissors, Lighter, and a tape measure

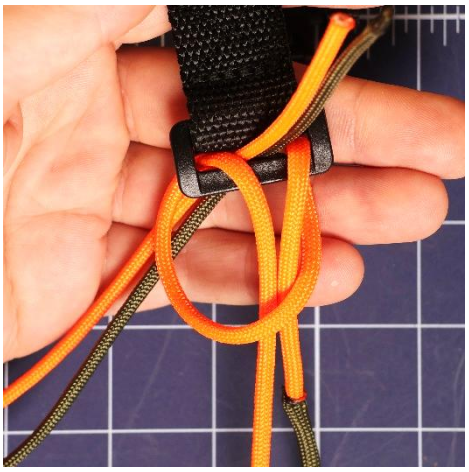

1. Melt one end of each 14 ft. cord and fuse them together. Repeat with the 16 ft. cords (set them aside until step 14).

2. Fold the connected 14 ft. cords in half (just off center to hide the connection). Push the fold through the plastic end on the webbing.

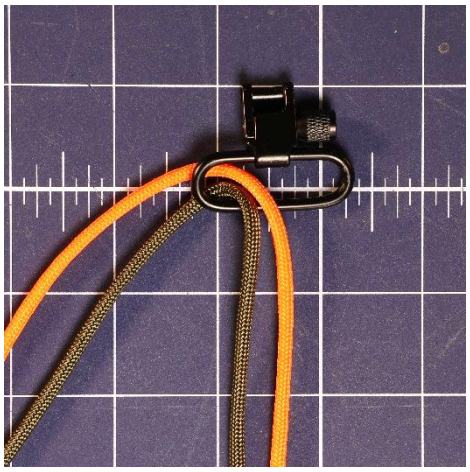

3. Pull the two cord ends down through the loop. This knot is known as a lark's head or cow hitch.

4. Insert both ends up through the back of the square plastic ring. Position them between your existing wrapped cords.

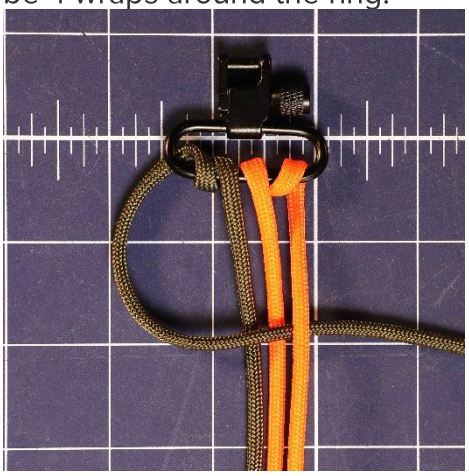

5. Thread them down through the loop of the cow hitch again and pull tight. There should now be 4 wraps around the ring.

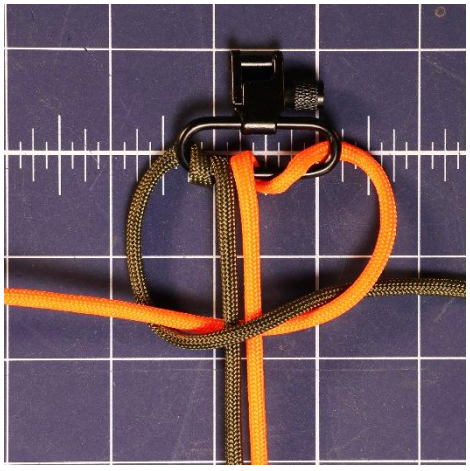

6. Thread the ends through the detached swivel. Make sure that your colors are not twisted around each other.

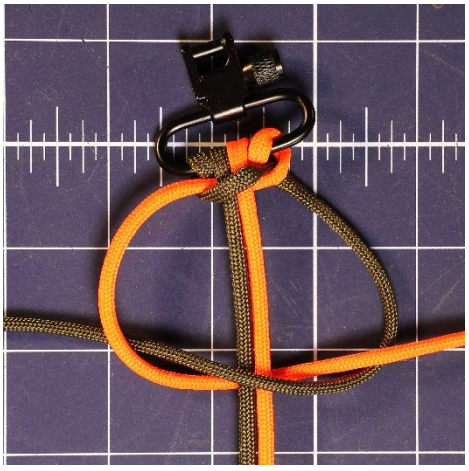

7. Wrap each cord around the swivel twice for a total of four wraps. Adjust the sling length so that the paracord portion measures 22".

8. Begin the cobra weave by placing the left cord over the top of the middle two and underneath the right cord.

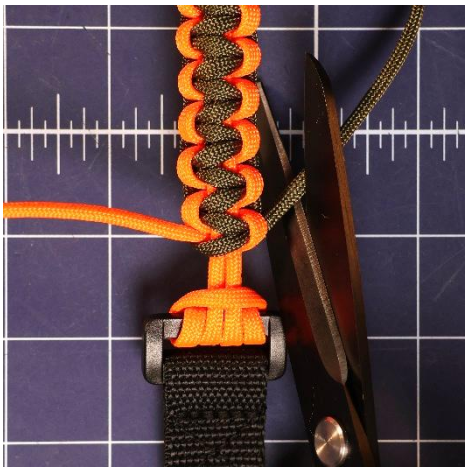

9. Bring the right cord around the back and up through the loop created by the left cord.

10. Pull the knot tight and mirror step 9. (Notice colors stay the same)

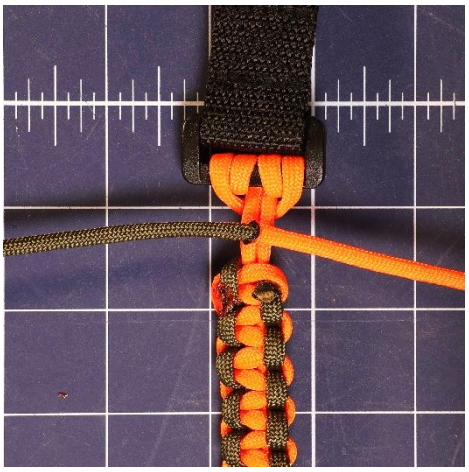

11. Repeat the pattern down the length of the sling.

12. Push the knots upward as you weave to eliminate gaps. When you reach the end, cut your cords 1/4" from the weave.

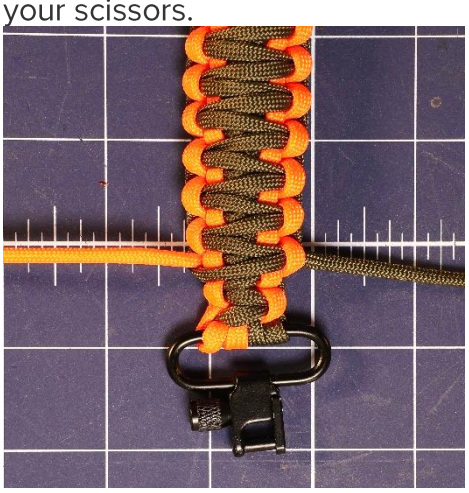

13. Melt each end with the lighter and flatten them against the weave using the side of your scissors.

14. Turn your sling around. Grab the connected 16 ft. pieces and hide the connection behind the end of your weave.

15. Weave another cobra weave over the top of the existing one. Make sure that the weave fits in between the bumps of the weave underneath.

16. When you reach the end, cut your cords 1/4" from the weave. Melt with lighter and flatten against weave with scissors.

17. Enjoy your completed sling!

A paracord gun sling is one of the most practical DIY paracord projects for hunters and outdoor enthusiasts, combining a custom look with real-world function. This tutorial uses the cobra weave, one of the most popular paracord knots thanks to its tight, flat pattern and beginner-friendly technique. Beyond style, a paracord rifle sling carries a built-in supply of cord you can unravel in the field for emergency repairs, shelter building, or gear lashing. Whether you choose blaze orange for visibility during hunting season or camo for a low-profile look, a handmade paracord sling is a durable, personalized upgrade that makes a great gift for any outdoorsman.

ABOUT PARACORD PLANET

Paracord Planet has been supplying extremely high-quality Paracord since 2011. By keeping an eye on market trends and our minds open to customer requests, we have maintained an edge over the stiff competition. Based out of Fargo, North Dakota, we are constantly being exposed to intense climate conditions, and each product is tested by our highly skilled employees. Driven by a natural desire to exceed your wildest expectations, our design and production specialists are always adding new, exclusive colors and patterns to our practically endless selection. In addition, our real live customer service team thrives off of personally responding to inquiries from Paracord enthusiasts of all skill levels, all over the world, from our planet to yours!
